TEMPERED UV GLASS
10D SEMI WITH GLUE-TOOL

Get the new revolutionary **UV GLASS 10D SEMI** screen protector from **IDOL 1991** and **VOLTE-TEL**, designed to impress even the most demanding users.

Using **Liquid Dispersion** technology, **IDOL 1991's** adhesive spreads and disperses evenly across the phone's screen, covering any **scratches or discolorations** and creating a tough and durable coating from edge to edge, while also **repairing** previous scratches or imperfections. The durable and resilient **UV 10D Tempered Glass from IDOL 1991** uses a new installation method with **special adhesive and ultraviolet (UV) light** for a complete and flawless application on your device's screen.

Thanks to this special process, **IDOL 1991's UV Glass** is the ideal solution, as it can be applied even to cracked or broken screens, preventing further spreading of the crack or damage.

This specific Tempered Glass is designed to be **fully compatible** with cases that have raised edges for the protection of the phone's screen, and it **does not affect** the screen's contrast, brightness, colors, or sensitivity as it is **100% transparent**. It has a high hardness rating of **9H**, making it very difficult to scratch or break. It is also made with high-precision, **rounded 10D edges** for greater safety and injury prevention, and in the event of a strong impact that causes it to break, it shatters into tiny pieces that do not scatter, just like a car windshield, ensuring there is no risk of injury to the user or scratches to the screen.

Finally, this revolutionary **UV GLASS 10D SEMI screen protector** does not interfere with fingerprint recognition.

Note: You must re-register your fingerprint after applying the Tempered Glass.
